

4. AMENDMENTS TO THE CLAIMS.

A. A complete listing of all of the claims is not present.

A complete listing of Claim No.1 and Claim No.2 is given below.

(1) CLAIM OR CLAIMS.

The flying object is made of two hollow discs welded on the circumference. High Pressure gas is generated inside the hollow portion. A number of nozzles are fixed around the circumference. The nozzles are fixed in such a manner that high pressure gas will leave tangentially to the disc. When high pressure gas leaves tangentially this force will impart a high speed rotary motion to the disc. When the speed increases and at very high speeds the disc will leave the ground and start flying at a high speed.

Claim No.1: I claim ^{the} high speed revolving disc leaving the ground and taking off is the main No.1 claim and this idea is to be patented.

Claim No.2: I claim that claim No.1 can be also achieved by making the escape of the gas by a micro processor controlled valve. In this case only gas will be ejected by the valve. I claim in this case the disc will leave the ground and take off without any rotary motion.

4. AMENDMENTS TO THE CLAIMS.

E. Claim 1 should include a status identifier.

Claim 1 has been presented previously^{in my previous letters} and there is no change.
